ដ New soluble recombinant protein, useful e.g. as immunostimulant, comprises dimeric major histocompatibility complex molecule fused immunoglobulin Fc region.

Example 1; Page 31-33; 43pp; French

The specification describes soluble recombinant proteins that comprise at least a dimer formed from the alpha and beta-chains of MHC (major histocompatibility complex) Class I and II molecules in which at least one chain has, attached to its C-terminus, at least part of the Fc region of an immunoglobulin. The recombinant proteins, when linked to an antigenic peptide, are used to count and/or purify antigen-reactive T lymphocytes and to characterize their phenotype, e.g. in preclinical evaluation of vaccines. They are also used as immunostimulants, particularly for vaccine development (against infections and tumours), to count and determine phenotype of autoreactive T cells in subjects with, or at risk of developing, autoimmune diseases, e.g. for staging or evaluating treatments, and (to purify and/or enrich Ag-reactive T cells from cell cultures or patient samples, for use in subsequent curative or preventative cellular therapy. The present sequence encodes a recombinant protein of the invention, comprising an alpha chain of MHC molecules

additions. The molecule of the invention may be useful for detecting an antigen-papecific CD4+ T-cell by flow cytometry and for presenting a microorganism-derived mucous membrane invasive protein as an antigen. The method of the invention enables efficient detection of antigen-specific activation of CD4+ T-cells in the amotous membrane. The current sequence is that of the class II major histocompatibility complex-related I-AD(alpha)-leucine zipper (LZ) fusion cDNA of the invention.

This nucleotide sequence comprises a PCR product obtained by amplification of mouse splenocyte cDNA using primers (see AAV12063 and AAV12064) designed for the amplification of Inda alpha chain full-length cDNA. IAd beta chain cDNA (see AAV12069) has been similarly obtained. The CDNA. IAd beta chain cDNA (see AAV12069) has been similarly obtained. The CDNA. IAd beta chain cDNA (see AAV12069) has been similarly obtained. The confirmation of CT and sequences were expressed at the cells. COMPLIANT (MHC) class II IAd heterodimers were expressed at the cells. The current on relates to the preparation and use of synthetic antigen conventing matrices, in particular antigen presenting colls such as insect cells that have been transfected to produce MHC antigen presenting confirmation of the matrices are used to activate naive CD4+ T cells and to shift the ongoing activation state into a preferred differentiated population of Th1 or Th2 cells. CAPICAL APPLICATIONS include the treatment of autoimmume disease, e.g. diabetes, multiple sclerosis, autoimmune thyroiditis, systemic lupus erythematosus, ather and contract conditions include the area of an asthma and contract conditions include and contract conditions and an another another and contract contract conditions include the another conditions include the another conditions and contract conditions and activate and contract conditions and co
                                                                                                                                                                                                           Major histocompatibility class II antigen; MHC class II; T cell; T lymphocyte; Th1; Th2; activation; CD4+; antigen presenting cell; APC; autoimmune disease; diabetes; multiple sclerosis; autoimmune thyroiditis; systemic lupus erythromatosus; mysathenia gravis; Crohn's disease; inflammatory bowel disease; allergy; asthma; contact sensitivity; immunotherapy; therapy; IAd alpha chain; mouse; ds; circular; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic antigen presenting cell for activating CD4+ T cells - usefutreat autoimmune disease, e.g. diabetes, multiple sclerosis, Crohn's disease and inflammatory bowel disease, or allergy, e.g. asthma and contact sensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 4713 BP, 1211 A, 1166 C, 1152 G, 1184 T, 0 U, 0 Other;

The present sequence encodes a novel soluble fused major histocompatibility complex (MHC) heterodimer:peptide complex, comprising thistocompatibility complex (MHC) heterodimer:peptide complex, comprising septide able to associate with a peptide binding groove of the MHC molecule, linked in frame to the 2nd domain by a 5-25 residue linker and a DNA encoding a 3rd MHC domain linked in frame to the DNA encoding the antendence peptide by a DNA encoding a 5-25 residue linker. The complex can be used to induce immunological tolerance in adults susceptible to, or suffering from an autoantigen related disease, e.g. insulin dependent class and antigen presenting cells, to induce anergy (immunological noncresponding antigen are permanently linked into a single chain, corresponding antigen are permanently linked into a single chain, obviating the requirement for complex heterodimer fruncation or formation, the complex eliminates inefficient and non-specific peptide loading. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ProValileAsnileThrTrpLeuArgAsnSerLysSerValThrAspGlyValTyrGlu 161
                                                                                                                                                        Novel fused major histocompatibility complex:antigenic peptide complex - useful to induce tolerance to an autoantigen-related disease e.g. insulin -dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GlubroGlnGlyGlyLeuGlnAsnIleAlaAlaGluLysHisAsnLeuGlyIleLeuThr 101

molecule of the invention

The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (MIC) class II molecule and a second recombinant single chain MHC class II molecule, each comprising an alphai domain and a betal domain linked through an amino acid linker and a multimerisation domain. The first and the second molecule are linked through the multimerisation domain. The first and the second multimeric complex, The complex is useful for treating autoimmune diseases. It is useful for treating insulin dependent disbetes, multiple eclerosis, myssthenia gravis, pernicious ansemia, autoimmune encephalomyelitis (EAE), rheumatoid arthritis and systemic lupus erythematogus. The present sequence encodes a single chain MHC class II

Wit (111) MHC - peptide. Wit (111) MHC - major histocompatibility glycoprotein; and the peptide includes an epitope associated with one of the major autoimmune diseases. The MHC is the N-terminal of alphal, alpha2, betal or beta2 regions of MHC-1I. The complexes can be used to treat and monitor the autoimmune diseases. In one protocol, an oligonucleotide encoding the AChR peptide 195-212 - an epitope in myasthenia gravis patients - was attached to the DNA encoding the N-terminal of the I-Ab-alpha chain. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated

Detecting pain responses in a cell, useful in identifying potential therapeutic and diagnostic candidates for treating pain, by identifying genes that are differentially expressed in a model of neuropathic pain.

Example 1; SEQ ID NO 435; 173pp; English.

This invention relates to a novel method of detecting a pain response in a cell which comparises determining the expression level in a test cell of at levels in an animal model of pain, where similar or identical expression levels in an animal model of pain, where similar or identical expression levels indicate a pain response in the test cell. The invention may be useful for the development of compounds with an analgesic, antiaddictive, noncropic, antionical managesic, antiaddictive, noncropic, antionical managesic, antiaddictive, noncropic, antionical managesic, antiantal managesic, operationic similar antionical, antiinflammaticy, antiprutific, dermatclogical, antiinflammaticy, antipruticic, dermatclogical, antiinflammatcy, antipruticic, dermatch activity whilst therapeutic and diagnostic candidates for treating pain, including agonists and antagonists for the gene or gene products as potential uneuropathic pain, nociceptive pain, chonical pain, including alsociated with rheumatic disease, and disociated with cancer, anxiety, depression, headache, asthma, rheumatic disease, and disociated with cancer, anxiety, depression, headache, asthma, rheumatic disease, decorbing a struction of presumed esophageal crisis, retinopathy, inflammatory eye disorders, pruritus, ulcer, inflammatory bowel disease, inflammatory bowel disease, inflammatory explain, functional disease, described and disease, described bladder disorder, inflammatory bowel disease, inflammatory inflammatory explain, functional disease, described bladder disorder, inflammatory bowel with demonstrated become and disease, and diseas analysed in the method of

```

```
The acetylcholine receptor alpha subunit given in sequence AAR45946 (corresponding mRNA in AAQ56918) and the myelin basic protein given in AAA45947 are antigenic peptides associated with autoantigens. They have been conjugated with MHC class II components such as I-Ab- alpha chain (encoded by sequene AAQ56919) and I-Ab-beta chain, (encoded by AAQ56920) and a toxin or label to form conjugates used to target helper T-cells for the treatment of autoimmune diseases. (Updated on 25-MAR-2003 to correct PF field.)

AAT17587 encodes a murine MHC fusion complex capable of modulating T cell activity encoded by the vector SCT1. The MHC fusion complex comprises at least one MHC molecule containing a peptide-binding groove and a presenting peptide covalently linked to the MHC molecule and opt. a presenting peptide covalently linked to the MHC molecule and opt. a transmembrane domain. DNA encoding a MHC fusion complex may be cloned into a host cell to express that modulate, pref. antagonise, T cell covacionity DNA encoding a MHC fusion complex or a single chain fusion complexes may be used to vaccinate a mammal against a trajected disorder. CT the fusion complexes may be used to suppress an immune response in an animal suffering from an immune disorder e.g. multiple sclerosis, insulincedependent diabetes mellitus, rheumatoid arthritis, mysathenia gravis or chronic allergies. The complexes may also be used in the treatment of livestock and pets such as cats and dogs. The MHC fusion complexes can be produced such that they contain a single antigenic peptide including one of known structure, additionally a wide range of peptides can be presented for T cell interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         792 decedirecrecagneaagaceacarreageceaceaceaceragecricrargeracaacr 851

Example 1; Fig 1; 148pp; English.

The invention relates to new single chain major histocompatibility complex (sc-MHC) class II complexes that comprise a peptide binding groove, and a modified class II beta 2 chain or covalently linked immunoglobulin (Ig) light chain content (II) region. The MHC complexes are useful for detection and analysis of peptide ligands, pathogenic Teclis, for functional, cellular and molecular assays. They can be used to identify and isolate T cell receptor and/or MHC agonists and antagonists. They can also be used to cells involved in immune-related disorders. They can also be used to raise antibodies and to screen immune cells. It is also use in a method of suppressing an immune response in mammals. The sc-MHC complexes comprising modified class II beta 2 chains and/or Ig-c1 regions are soluble and provide enhanced yield. These MHC complexes also contain single antigent peptides readily isolated from expressing cells in significant quantities. The polyspecific MHC complexes also provide a means to detect cells expressing multiple target structures with a single complex. The present sequence represents a DNA encoding a single chain

Also included are a DNA construct coding for the complex, where the MHC molecule is a class II MHC (e.g. mouse I.Ad or I-As or I human HLA-DR1 (human leukecyte antigen-DR1), a multivalent MHC fusion complex comprising two or more linked complexes, identifying a peptide that can modulate the activity of T cells (involving introducing into host cells cloning vectors that each contain the fusion complex DNA, culturing the host cells under conditions suitable for expression of the MHC fusion complex, and selecting host cells that express MHC fusion complex that modulate the activity of T cells), a single recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel major histocompatibility complex fusion complex having presenting peptide covalently linked to MHC molecule containing peptide-binding groove, used for suppressing immune response in multiple sclerosis,

```

expression vector comprising DNA that codes for the alpha and beta chains of the fusion complex MMC protein, a single recombinant expression vector comprising DNA that codes for a T cell costinulatory factor and the alpha and beta chains of the MMC fusion complex. The DNA constructs can contain heterologous leader peptide sequences and Kozak sequence for efficient expression of the fusion complex. Also included are inducing an immune response in a mammal (including vaccinating a mammal against a targeted disorder, by administering DNA sequence comprising a fusion complex, or DNA sequence coding for a fusion complex which is a single chain fusion molecule) and suppressing an immune response in a mammal by administering to the mammal a DNA sequence comprising an expression vector, encoding a full length MMF molecule that contains a transmembrane domain, and a presenting peptide that is a T cell receptor (TCR) antagonist or partial agonist and is covalently linked to the MMC protein, or DNA sequence coding for the fusion complex which is a single chain fusion molecule. The methods are useful for identifying a peptide that can modulate the activity of T cells, inducing an immune response in a mammal (including vaccinating a mammal against a targeted disorder) and for suppressing an immune response in a mammal against insulin-dependent diabetes mellitus, rheumatoid arthritis, myasthenia gravis or chronic allergies. The present sequence encodes a mouse MHC class II I-Ad fusion complex of the

Sequence 1508 BP; 337 A; 413 C; 441 G; 317 T; 0 U; 0 Other;

A novel soluble fused major histocompatibility complex (MHC)

heterodimer:peptide complex, comprises DNA encoding 1st and 2nd MHC

comains, e.g. the present sequence, linked by DNA encoding a 5-25 residue

linker, and a DNA encoding an antiquency peptide able to associate with a

complex and a DNA encoding an antiquency peptide able to associate with a

complex can be used to induce immunological tolerance in adults

complex can be used to induce immunological tolerance in adults

cusceptible to, or suffering from an autoantigen related disease, e.g.

susceptible to, or suffering from an autoantigen related disease, e.g.

insulin dependent diabetes mellitus (IDDM), by antagonising the binding

of particular T cells and antigen presenting cells, to induce anergy

(Immunological non-responsiveness) in the targeted T cell. As the

cherrodimers and corresponding antigen are permanently linked into a

single chain, obviating the requirement for complex heterodimer

cruncation or formation, the complex eliminates inefficient and non-

specific peptide loading. (Updated on 27-AUG-2003 to correct OS field.)

```
The AChR peptide 195-215, which has been characterised as an epitope in myasthenia gravis (MG) in humans and in mice, may be connected to the N-terminal antigen binding site of a polypeptide derived from an MHC antigen associated with MG. For example, if the recombinant complex is to be used in mice, the AChR peptide may be incorporated into a sequence encoding either the I-Ab-alpha or I-Ab-beta chain (see AAQ35054-55 respectively). If the AChR peptide is to be incorporated into the beta chain, for example, the oligonucleotide may be inserted as a replacement for the leader sequence. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    185
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PheGluProGinGlyGlyLeuGlnAsnileAlaAlaGluLysHisAsnLeuGlyIleLeu 100

AAP

The specification describes soluble recombinant proteins that comprise at least a dimer formed from the alpha and beta-chains of MHC (major histocompatibility complex) Class I and II molecules in which at least one chain has, attached to its C-terminus, at least part of the FC region of an immunoglobulin. The recombinant proteins, when linked to an antigening peptide, are used to count and/or purify antigen-reactive T lymphocytes and to characterize their phenotype, e.g. in preclinical evaluation of vaccines. They are also used as immunostimulants, particularly for vaccine development (against infections and tumours), to count and determine phenotype of autoreactive T cells in subjects with, or at risk of developing, autoimmune diseases, e.g. for staging or evaluating treatments, and (to purify and/or enrich Agreactive T cells from cell cultures or patient samples, for use in subsequent curative or preventative cellular therapy. The present sequence encodes a recombinant protein of the invention, comprising an alpha chain of MHC molecules

Multimeric complex for treating autoimmune diseases, comprises first and second single chain MHC class II molecules, each comprising alphal and betal domain linked through amino acid linker and multimerization domain.

Disclosure, Page 115; 147pp; English.

The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (MHC) class II molecule and a second recombinant single chain MHC class II molecule, each comprising an alphal domain and a betal domain linked through an amino acid linker and a multimerisation domain. The first and the second molecule are linked through the multimerisation domain to form a multimeric complex, The complex is useful for treating autoimmune diaeases. It is useful for treating insulin dependent diabetes, multiple sclerosis, myasthenia gravis, pernicious anaemia, autoimmune encephalomylitis (RAB), rheumatoid arthritis and systemic lupus molecule of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This nucleotide sequences codes for a bivalent DR2 fusion protein obtained by fusion of the Pc portion of 1962a to the 3' end of a DR-alpha PCS cDNA construct (see AAV16866). The Pc portion was amplified by RT-PCR from mouse hybridoma 1243. The PCR product was then fused in frame with the DR alpha-POS construct by overlapping PCR. The DR2-19G fusion was expressed in the Drosophila Schneider cell system. The invention relates to new soluble monovalent and multivalent Class II MHC fusion proteins comprising a MHC class II binding domain and a dimerisation domain or an immunoglobulin region that can be used for the treatment of allergic and autoimmune diseases (e.g. multiple sclerosis), for tolerising a subject to foreign tissue before or after organ or tissue transplantation, or for vaccination against pathogens. This nucleotide sequence codes for a divalent HIA-DR2 MHC binding domain fusion protein (see AAY31654) comprising an alpha-mating factor secretion signal, the extracellular domain of the HIA-DR2 alpha chain (residues 1-191 of DRA*0101), a 7-amino acid linker, the 40-amino acid leucine zipper dimerization domain of Fos, and the Fc portion of 1gG2a. The DR-alpha-Fc chain corresponds to an antibody heavy chain. The invention provides new monovalent, multivalent and multimeric MHC Class II binding domain fusion proteins and conjugates comprising at least a binding domain of an MHC

Example 7, Page 100-102; 113pp; English.

```
Class II alpha or beta chain and a dimerization domain, especially a Fosor or Jun leucine zipper domain. The MHC fusion proteins and conjugates can be used if for detecting and isolating T cells having a defined MHC/peptide complex specificity (claimed); to confer to a subject adoptive immunity to a defined MHC/peptide complex (claimed) is to stimulate or activate T cells reactive to a defined MHC/peptide complex (claimed); for selective killing of T cells reactive to a defined MHC/peptide complex (claimed); to treat claiming of T cells reactive to a defined MHC/peptide complex (claimed); to treat allergic and autoimmune diseases, e.g. multiple sclerosis, rheumatoid arthitis, pemphigus vulgaris, and systemic lupus erythematosus; and to prevent organ or tissue transplant rejection. The DR2-IgG design was chosen to increase the affinity for the T cell receptor by increasing valency, and to attach an effector domain, the Rc region of IgG2a.

Complement fixation may result in the lysis of target T cells following binding of DR2-IgG molecules can any therefore be useful for the selective depletion of autoaggressive T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        235
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     230 rcarcacaaagcecriccaacraracrecearcaccaargraccrecagaggraacrefee

The invention is useful in adoptive immunotherapy and tolerizing against foreign tissue. The invention is also useful for treating autoimmune diseases such as pemphigus vulgaris, rheumatoid arthritis, multiple sclerosis and systemillupus erythematosus. The present sequence is the DRZ-IGG fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel class II major histocompatibility complex (MHC) fusion protein having MHC class II binding domain of MHC class II alpha chain, and dimerization domain, useful for treating pemphigus vulgaris, rheumatoid

The first and the second molecule are linked through the multimerisation domain. The first and the second multimeric complex, The complex is useful for treating autoimmune diseases. It is useful for treating insulin dependent diabetes, multiple scleroslis, myasthenia gravis, pernicious ansemia, autoimmune encephalomyelitis (BAE), rheumatoid arthritis and systemic lupus erythematogus. The present sequence encodes a single chain MHC class II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Multimeric complex for treating autoimmune diseases, comprises first and second single chain MHC class II molecules, each comprising alphal and betal domain linked through amino acid linker and multimerization domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mouse; MHC; major histocompatibility complex; MHC class II; multimer; single chain; immunosuppressive; antidiabetic; antiinflammatory; antiansemic; antizheumatoid; antiarthritic; neuroprotective; vaccine; autoimmune disease; insulin dependent diabetes; multiple sclerosis; myasthenia gravis; pernicious anaemia; autoimmune encephalomyelitis; rheumatoid arthritis; systemic lupus erythematosus; ss.

The invention relates to a multimeric complex comprising a first recombinant single chain major histocompatibility complex (MHC) class II molecule and a second recombinant single chain MHC class II molecule, each comprising an alphal domain and a betal domain linked through an amino acid linker and a multimerisation domain. The first and the second molecule are linked through the multimerisation domain to form a multimeric complex, The complex is useful for treating autoimmune diseases. It is useful for treating insulin dependent diabetes, multiple sclerosis, myasthenia gravis, pernicious anaemia, autoimmune encephalomyelitis (RAB), rheumatoid arthritis and systemic lupus erythematosus. The present sequence encodes a single chain MHC class II molecule of the invention

The present invention relates to a fusion protein consisting of wild-type interleukin-15 (IL-15) and an immunoglobulin G (IgG) Fc fragment, other than a murine IgG2b Fc fragment. The fusion proteins and coding sequences are used to prevent or treat consequences of transplantation and/or autoimmune diseases, e.g. rheumatoid arthritis, diabetes, multiple sclerosis, psoriasis, neurodermatitis, ulcerative colitis, tumours and AIDS, etc., and tissues or organs that express the protein are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New fusion protein of interleukin-15 and Pc fragment, useful for treating e.g. transplantation disorders, autoimmune diseases and tumors, also related nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                     1420 TCAGTGGTCCACGAGGGTCTGCACAATCACCACACGACTAAGAGCTTCTCCCGGACTCCG

The fusion proteins and coding sequences are used to prevent or treat consequences of transplantation and/or autoimmune diseases, e.g. rheumatoid arthritis, diabetes, multiple sclerosis, psoriasis, neurodermatitis, ulcerative colitis, tumours and AIDS, etc., and tissues or organs that express the protein are useful for transplants. Also transpend animals, as allo, auto. or xenotransplants. Also transgenic animals that express the fusion proteins are useful as source of cells, tissues and organs for transplantation or to screen for pharmaceuticals and/or to identify toxic substances. The present sequence is a polypeptide coding sequence used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          675

The present invention relates to a fusion protein consisting of wild-type interleukin-15 (IL-15) and an immunoglobulin G (IgG) Pc fragment, other than a murine IgG2b Pc fragment. The fusion proteins and coding sequences are used to prevent or treat consequences of transplantation and/or autoimmune diseases, e.g. rheumatoid arthritis, diabetes, multiple sclerosis, psoriasis, neurodermatitis, ulcerative colitis, tumours and AIDS, etc., and tissues or organs that express the protein are useful for transplantation into humans or other mammals, as allo, auto- or xeno-transplants. Also transgenic animals that express the fusion proteins are useful as source of cells, tissues and organs for transplantation or to screen for pharmaceuticals and/or to identify toxic substances. The present sequence is a coding sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```

New polypeptide comprises a sequence of amino acids that is selectively reactive with beta-amyloid peptide 42 or at least one complementarity-

```
This invention relates to novel methods and compositions for detecting and modulating beta-amyloid (A-beta) peptide levels and the processing of amyloid beta A precursor protein (APP). Specifically, it refers to methods of assessing the presentlin activity of compounds using the lipoprotein receptor related protein (LRP), in order to identify to presentlin proteins that can be used to affect the processing of APP. The presentlin proteins that can be used to affect the processing of APP. The presentlin activity and A-beta levels, in particular beta-amyloid 42 (A-beta 42), such that the agent is selectivity reactive with A-beta 42 and binds at least one complementarity determining region (CDR) of either antibody A387 or antibody 8436. As such, the polypeptides, nucleic acids and antibodies are useful for treating Alzheimer's disease, accordingly the compositions exhibit neuroprotective and nootropic activities. This polymucleotide sequence is a murine antibody chain DNA fragment of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1085

for Novel non-murine antibody that competes with monoclonal antibody RXI binding to macrophage colony stimulating factor, useful for treating hypogonadism, hypercalcemia, rickets, scurvy, homocystinuria, cancer, osteoporosis.

Claim 67; SEQ ID NO 1; 269pp; English.

The invention describes a non-murine antibody (I) that competes with monoclonal antibody RX1 for binding to macrophage colony stimulating factor (M-CSF) by more than 75t, where the monoclonal antibody RX1 has the heavy chain and light chain amino acid sequences having a fully defined 447 amino acids (SEQ ID No. 2) and 214 amino acids (SEQ ID No. 4) sequences given in the specification, respectively. (I) is useful for preventing a subject afficted with a disease that causes or contributes to osteolysis, where the antibody effectively reduces the severity of bone loss associated with the disease. The disease is chosen from metabolic bone diseases associated with relatively increased osteoclast activity, including endocrinopathies, hypercalcemia, deficiency states, chronic diseases, and hereditary diseases, cancer, osteoporosis, osteoperosis, inflammation of bone associated with arthritis and rheumatoid arthritis, periodontal disease, fibrous dysplasia, and/or paget's disease. (I) is useful for preventing or treating metastatic cancer. Antibodies of the invention are useful for preventing or reducing bone loss; osteolysis; metastatic cancer to bone and cancer. (I) is useful for sease that causes or contributes to osteolysis, and metastatic cancer the bone in a patient for meanifecturing a medicament for preparing a patient while cancer, for manufacturing a medicament for treating apatient having cancer. (I) in synergistic combination, is useful for preparing a
